UNNI C02 SMARTIFICATION – REV A

Two-sheet cleanup: standard power symbols, grid-aligned wiring, explicit local connectivity.

[illegible]

The schematic diagram illustrates the power supply and I2C interface of the ADXL345 module. The power supply section includes a +BATT input connected to a 5V regulator (U3, TPS613222A). The regulator's output is connected to a +5V supply, which is then connected to the VBUS pin of the ADXL345 (U1). A 10k resistor (R8) is connected between the VBUS pin and ground. The ADXL345 is also connected to a 3.3V supply (VDDIO) and a 1k resistor (R7) connected to ground.

ESP32-C6 + AUXILIARY CIRCUITS

GPIO0-3 are reserved for ADC inputs; RT/RH use RTC-capable GPIO6/7 for deep-sleep wake.

SIMULATION HARNESS – excluded from BOM/PCB

Scenario: battery-only → forced awake → USB hot-plug while BOOST_CMD remains asserted → autonomous charging → USB removal. Battery model includes 120 mΩ ESR. Battery model includes 120 mΩ ESR. I2 is the 3V3-converter input-power proxy. TPS613222A input power/discharge is modeled internally; legacy I3 is excluded from simulation.
